## INTERNATIONAL ELECTROTECHNICAL COMMISSION

---

### HYDRAULIC TURBINES, STORAGE PUMPS AND PUMP-TURBINES – TENDERING DOCUMENTS –

#### Part 5: Guidelines for technical specifications for tubular turbines

#### FOREWORD

- 1) The IEC (International Electrotechnical Commission) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of the IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, the IEC publishes International Standards. Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. The IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of the IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested National Committees.
- 3) The documents produced have the form of recommendations for international use and are published in the form of standards, technical reports or guides and they are accepted by the National Committees in that sense.
- 4) In order to promote international unification, IEC National Committees undertake to apply IEC International Standards transparently to the maximum extent possible in their national and regional standards. Any divergence between the IEC Standard and the corresponding national or regional standard shall be clearly indicated in the latter.
- 5) The IEC provides no marking procedure to indicate its approval and cannot be rendered responsible for any equipment declared to be in conformity with one of its standards.
- 6) Attention is drawn to the possibility that some of the elements of this International Standard may be the subject of patent rights. The IEC shall not be held responsible for identifying any or all such patent rights.

The main task of IEC technical committees is to prepare International Standards. In exceptional circumstances, a technical committee may propose the publication of a technical report of one of the following types:

- type 1, when the required support cannot be obtained for the publication of an International Standard, despite repeated efforts;
- type 2, when the subject is still under technical development or where for any other reason there is the future but no immediate possibility of an agreement on an International Standard;
- type 3, when a technical committee has collected data of a different kind from that which is normally published as an International Standard, for example "state of the art".

Technical reports of types 1 and 2 are subject to review within three years of publication to decide whether they can be transformed into International Standards. Technical reports of type 3 do not necessarily have to be reviewed until the data they provide are considered to be no longer valid or useful.

IEC 61366-5, which is a technical report of type 3, has been prepared by IEC technical committee 4: Hydraulic turbines.

The text of this technical report is based on the following documents:

Committee draft	Report on voting
4/110/CDV	4/122/RVC

Full information on the voting for the approval of this technical report can be found in the report on voting indicated in the above table.

Technical Report IEC 61366-5 is one of a series which deals with Tendering documents for hydraulic turbines, storage pumps and pump-turbines. The series consists of seven parts:

Part 1: General and annexes (IEC 61366-1)

Part 2: Guidelines for technical specification for Francis turbines (IEC 61366-2)

Part 3: Guidelines for technical specification for Pelton turbines (IEC 61366-3)

Part 4: Guidelines for technical specification for Kaplan and propeller turbines (IEC 61366-4)

Part 5: Guidelines for technical specification for tubular turbines (IEC 61366-5)

Part 6: Guidelines for technical specification for pump-turbines (IEC 61366-6)

Part 7: Guidelines for technical specification for storage pumps (IEC 61366-7)

Parts 2 to 7 are "stand-alone" publications which when used with Part 1 contain guidelines for a specific machine type (i.e. Parts 1 and 4 represent the combined guide for Kaplan and propeller turbines). A summary of the proposed contents for a typical set of Tendering documents is given in the following table 1 and annex A. Table 1 summarizes the arrangement of each part of this guide and serves as a reference for the various chapters and sections of the Tendering documents (see 3.2 of this part).

**Table 1 – Summary of guide for the preparation of Tendering documents for hydraulic turbines, storage pumps and pump-turbines**

CONTENTS OF GUIDE IEC 61366-1 TO IEC 61366-7			SAMPLE TABLE OF CONTENTS OF TENDERING DOCUMENTS (TD) (Example for the Francis turbines; see 61366-1, annex A)

			6.8	Technical specifications for auxiliary systems
			6.9	Technical specifications for instrumentation
			6.10	Spare parts
			6.11	Model tests
			6.12	Installation and commissioning
			6.13	Field acceptance tests
1		Annexes		
A		Sample table of contents of Tendering documents for Francis turbines		
B		Comments on factors for evaluation of tenders		
C		Check list for tender form		
D		Examples of technical data sheets		
E		Technical performance guarantees		
F		Example of cavitation pitting guarantees		
G		Check list for model test specifications		
H		Sand erosion considerations		
2 to 7		Technical specifications		
2		Francis turbines		
3		Pelton turbines		
4		Kaplan and propeller turbines		
5		Tubular turbines		
6		Pump-turbines		
7		Storage pumps		

## HYDRAULIC TURBINES, STORAGE PUMPS AND PUMP-TURBINES – TENDERING DOCUMENTS –

### Part 2: Guidelines for technical specifications for tubular turbines

#### 0 Introduction to technical specifications

The main purpose of the technical specifications is to describe the specific technical requirements for the hydraulic machine for which the Tendering documents (TD) are being issued. To achieve clarity and to avoid confusion in contract administration, the Employer should not specify anything in the technical specifications which is of importance only to the preparation of the tender. Such information and instructions should be given only in the instructions to Tenderers (ITT). Accordingly, the ITT may refer to other chapters and sections of the Tendering documents but not vice versa. *As a general rule the word "Tenderer" should be confined in use only to TD Chapter 1 "Tendering requirements"; elsewhere the term "Contractor" should be used.*

Special attention should be given to items of a project specific nature such as materials, protective coating systems, mechanical piping systems, electrical systems and instrumentation. It is common for the Employer to use technical standards for such items which would apply to all contracts for a particular project or projects. In this event, detailed technical standards should be specified in TD Chapter 5 "General requirements".

Technical specifications for the various types of hydraulic machines included in this guide are provided in the following parts:

- Francis turbines (Part 2);
- Pelton turbines (Part 3);
- Propeller and Kaplan turbines (Part 4);
- Tubular turbines (Part 5);
- Pump-turbines (Part 6);
- Storage pumps (Part 7).

The guidelines for preparation of tubular turbine specifications include technical specifications for the following:

- Design conditions: Project arrangement, hydraulic conditions, mode of operation, generator characteristics, transient behaviour data, stability of the system, noise, vibration, pressure fluctuations and safety requirements.
- Technical performance and other guarantees:
  - power;
  - discharge;
  - efficiency;
  - maximum momentary pressure;
  - minimum momentary pressure;
  - maximum momentary overspeed;
  - maximum steady-state runaway speed;

- cavitation pitting;
- hydraulic thrust;
- maximum weights and dimensions for transportation, erection and maintenance.
- Mechanical design criteria: design standards, stresses and deflections and special design considerations.
- Design documentation: Contractor's input needed for the Employer's design, the Contractor's drawings and data, Contractor's review of the Employer's design and technical reports by Contractor.
- Materials and construction: material selection and standards, quality assurance procedures, shop methods and personnel, corrosion protection and painting.
- Shop inspection and testing: general requirements and reports, material tests and certificates, dimensional checks, shop assembly and tests.
- Fixed/embedded components: generator hatch cover or pit, stay ring, discharge ring (if any), draft tube, draft tube liner foundations anchorage, upstream and downstream pressure taps and pipes.
- Stationary/removable components: bulb nose, generator access shaft inner and outer guide rings and guide vanes.
- Regulating apparatus: servomotor, counterweight, connecting rods, regulating ring, guide vane linkage, system, guide vane overload protection and locking devices.
- Rotating parts, bearings and seals: runner, main shaft, guide bearing, main shaft seal, oil head and runner blade regulation system with servomotor assembly with oil supply, linkage system, crosshead and oilhead.
- Thrust and counter-thrust bearing: bearing support, thrust collar and counter-thrust bearing pads and rings, oil sump and instrumentation.
- Gear box: gear box and related components.
- Miscellaneous components: walkways, platforms, lifting fixtures, special tools, standard tools and nameplate.
- Auxiliary systems: water supply to main shaft seal, turbine drainage, lubrication-guide vane regulating system, and oil supply to bearings.
- Instrumentation: controls, indication and protection.
- Spare parts: basic spare parts.
- Model acceptance tests: test requirements.
- Site installation and commissioning test: installation procedures and commissioning.
- Field acceptance tests: scope of field test scope and reports and inspection of cavitation pitting.

An example of the proposed table of contents for Tendering documents for a Francis turbine is given in annex A of IEC 61366-1. The example does not include technical specifications for the control system, relief valves, or high and low pressure slide valves or gates which, at the Employer's option, may be included in the Tendering documents for the turbine or may be specified in separate documents.

Chapter 6 (technical specifications) of the Tendering documents should be arranged as follows:

- 6.1 Technical requirements;
- 6.2 Technical specifications for fixed/embedded components;
- 6.3 Technical specifications for stationary/removable components;
- 6.4 Technical specifications for guide vane regulating apparatus;
- 6.5 Technical specifications for rotating parts, guide bearings and seals;
- 6.6 Technical specifications for thrust bearing;
- 6.7 Technical specifications for gear box;

- 6.8 Technical specifications for miscellaneous components;
- 6.9 Technical specifications for auxiliary systems;
- 6.10 Technical specifications for instrumentation;
- 6.11 Spare parts;
- 6.12 Model acceptance tests
- 6.13 Site installation and commissioning
- 6.14 Field acceptance tests

## 1 Scope

This technical report, referred to herein as the Guide, is intended to assist in the preparation of Tendering documents and tendering proposals and in the evaluation of tenders for hydraulic machines. This part of IEC 61366 provides guidelines for tubular turbines.
