#### **Part 2: Hazard analysis at top system level**

#### FOREWORD

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publication(s)"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any services carried out by independent certification bodies.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

The main task of IEC technical committees is to prepare International Standards. However, a technical committee may propose the publication of a technical report when it has collected data of a different kind from that which is normally published as an International Standard, for example "state of the art".

IEC 62267-2, which is a technical report, has been prepared by IEC technical committee 9: Electrical equipment and systems for railways.

The text of this technical report is based on the following documents:

Enquiry draft	Report on voting
9/1390/DTR	9/1423A/RVC

Full information on the voting for the approval of this technical report can be found in the report on voting indicated in the above table.

This publication has been drafted in accordance with the ISO/IEC Directives, Part 2.

A list of all parts of IEC 62267 series, under the general title *Railway applications – Automated urban guided transport (AUGT) – Safety requirements*, can be found on the IEC website.

The committee has decided that the contents of this publication will remain unchanged until the stability date indicated on the IEC web site under "<http://webstore.iec.ch>" in the data related to the specific publication. At this date, the publication will be

- reconfirmed,
- withdrawn,
- replaced by a revised edition, or
- amended.

A bilingual version of this publication may be issued at a later date.

## INTRODUCTION

This Technical Report publishes the hazard analysis at top system level conducted by members of working group 45 of IEC technical committee 9 in order to allocate possible safeguards able to compensate for the absence of a driver in the front cabin of the train or attendant staff from the train as mentioned in 4.2 of IEC 62267:2009.

The hazard analysis is structured in accordance to basic functions of train operations following Table 1 of IEC 62267:2009 covering the basic hazards of train operations.

The hazard analysis tabulates the identified hazards with their associated causes and triggers as well as providing an associated list of possible safeguards able to compensate the absence of operational staff from the front cabin of a train. The results of hazard analysis do not state the choice of safeguards or the acceptable level of residual risk which may vary depending on the local safety culture. The choice of a listed safeguard or combination of safeguards, or the choice not to use any safeguard to compensate or mitigate a specific hazard in a specific application depends on the risk tolerability which is to be assessed under the responsibility of the Transport Authority and Safety Regulatory Authority by a specific risk analysis. This technical report, therefore, does not judge whether a safeguard or a combination of safeguards is necessary.

However, this technical report is intended to support Transport Authorities and Safety Regulatory Authorities in hazard identification as well as selecting and combining safeguards as a basis for a specific risk analysis required for any application with regard to their local safety culture.

IEC 62267 can be seen as a generic guideline specifying detailed safety requirements for safeguards proposed as a result of the present generic hazard analysis for the design of specific AUGT systems. The hazard analysis and the safeguards derived from it, together with their safety requirements, are based on experiences gained from design and operation of existing AUGT systems in North America, Europe and Asia.

The present generic hazard analysis and the derived safety requirements can be seen and used as part of the lifecycle of the system as defined in IEC 62278, required for any railway application including AUGT systems. The present hazard analysis covers the required hazard identification as part of risk analysis (lifecycle phase 3) and determination of safety-related system requirements (lifecycle phase 4) on a generic level, which is indispensable for design/implementation of an AUGT system. Because IEC 62267 specifies safety requirements on a generic level only, a specific risk analysis including specific hazard identification must be conducted. In order to facilitate the process of specific risk analysis and determine system requirements, the present hazard identification, the list of possible safeguards and the methodology can be used as a guide to verify the conditions of specific system environment.

The use of the present hazard analysis and derived methodology can additionally help harmonize the process of specific risk analysis in this field of application. Such a harmonized process has the intention to facilitate the necessary agreements between Transport Authorities and the resulting approval by Safety Regulatory Authorities.

# **RAILWAY APPLICATIONS – AUTOMATED URBAN GUIDED TRANSPORT (AUGT) – SAFETY REQUIREMENTS –**

## **Part 2: Hazard analysis at top system level**

### **1 Scope**

This technical report provides a non normative generic hazard analysis at top system level conducted for the development of IEC 62267 for Automated Urban Guided Transport (AUGT) systems. This report is applicable to all systems covered by the scope of IEC 62267.

This generic hazard analysis cannot be used for specific applications without taking into account the specific system environment and local safety culture.

This generic hazard analysis can be used for specific AUGT systems to support the necessary activities in lifecycle process following IEC 62278 (RAMS).
