INTERNATIONAL ELECTROTECHNICAL COMMISSION

GENERIC SPECIFICATION OF INFORMATION ON PRODUCTS –

Part 1: Principles and methods

FOREWORD

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publication(s)"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC provides no marking procedure to indicate its approval and cannot be rendered responsible for any equipment declared to be in conformity with an IEC Publication.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

A PAS is a technical specification not fulfilling the requirements for a standard, but made available to the public.

IEC/PAS 62569-1 has been prepared by technical committee 3: Information structures, documentation and graphical symbols.

The text of this PAS is based on the following document:

This PAS was approved for publication by the P-members of the committee concerned as indicated in the following document

Draft PAS	Report on voting
3/940/PAS	3/944/RVD

Following publication of this PAS, which is a pre-standard publication, the technical committee or subcommittee concerned may transform it into an International Standard.

This PAS shall remain valid for an initial maximum period of 3 years starting from the publication date. The validity may be extended for a single 3-year period, following which it shall be revised to become another type of normative document, or shall be withdrawn.

A list of all parts of IEC 62569 series, under the general title *Generic specification of information on products*, can be found on the IEC website.

INTRODUCTION

This PAS is intended as the first part of a standard series defining methods and guidelines for the establishing of generic electronic specifications of information for products (including plants, systems, equipment or components, in the following all called products), along its life cycle for later use e.g. in the procurement, operating and maintenance.

This series is prepared to transfer the former paper-based applications of blank detail specifications or product descriptions towards supporting the electronic business allowing the evaluation and management of described items by computers.

This PAS establishes general principles required for the other parts of this series. It specifies the infrastructure required to manage the product-related information as described in the following parts along the life cycle.

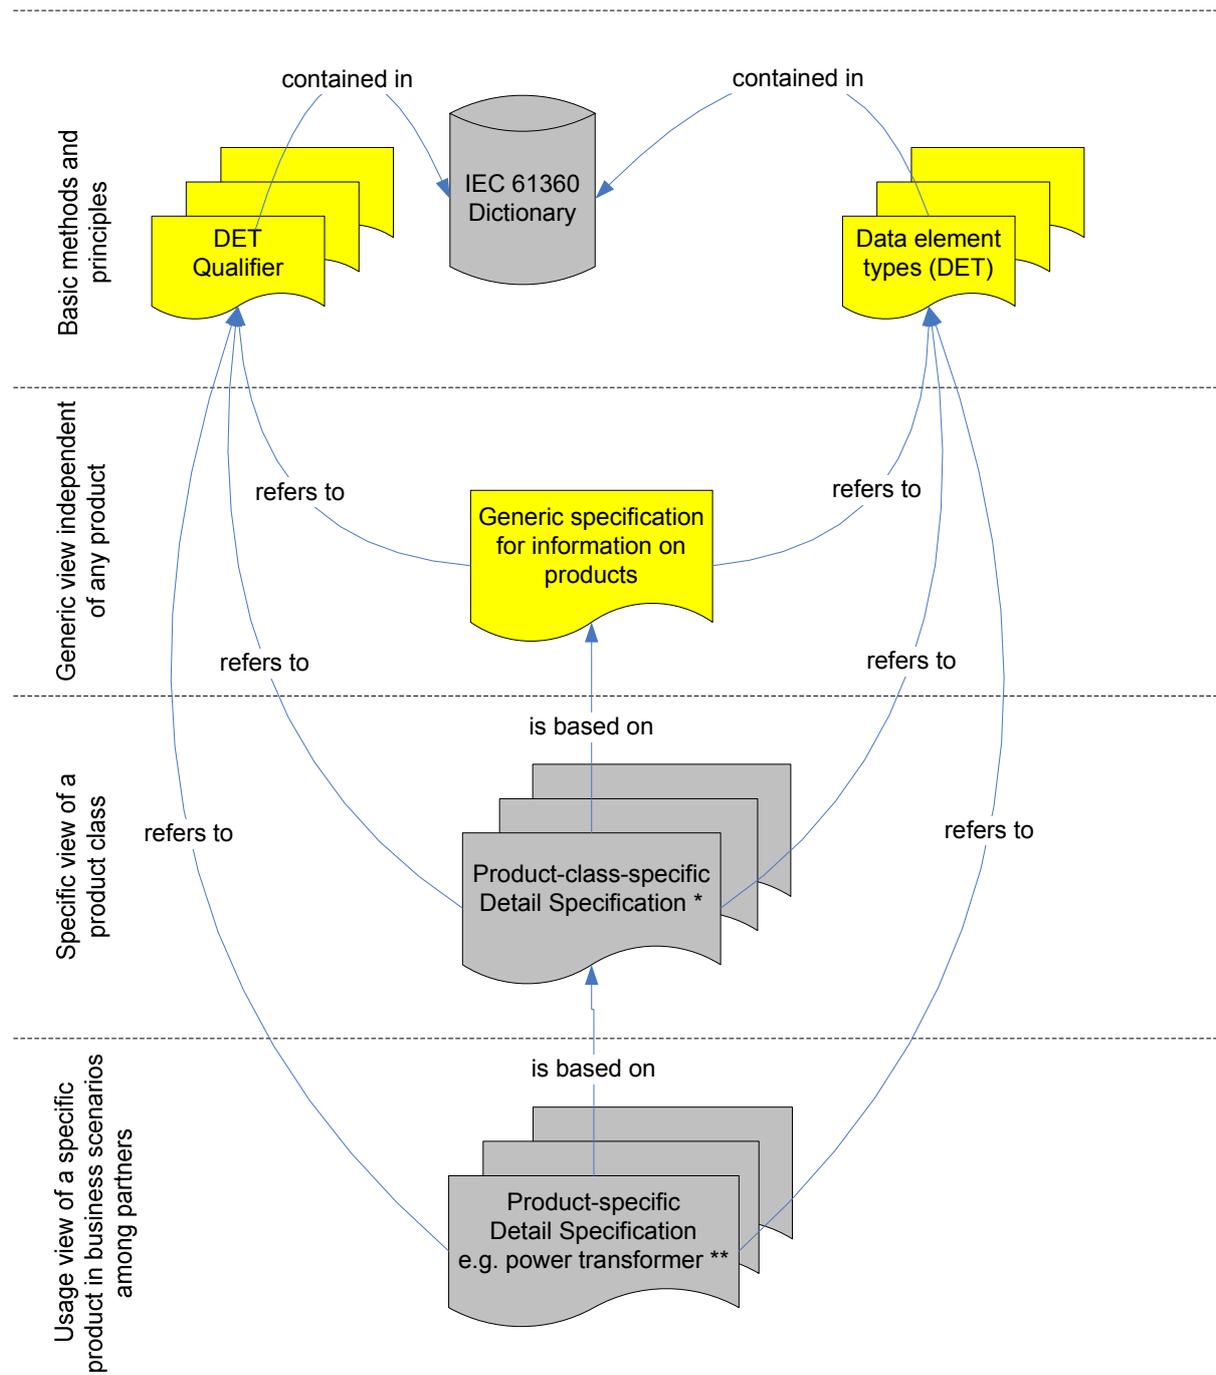

Part 2 provides a generally applicable structure of a generic specification of information on products presenting those common clauses which are independent of any specific equipment, component and device. It serves as a guide for the preparation of technical specifications for various items. Due to its generic type, particular issues referring to specific product classes are excluded. These need to be obtained from the specific product descriptions within product standards.

Part 2 is the basis for an XML based electronic template, serving as generic template for the development of product-specific specifications of information by product committees within IEC and ISO, industrial consortia or other industrial organizations.

The result of such product-specific blank detail specifications may be made available as a web-based collection of product-specific specifications for information, allowing users and technical committees to upload and/or download detail specifications for industrial use in the business process.

A prerequisite of the above series is the existence of an international available data dictionary, providing collections of data element types following common methods as defined in the IEC 61360 series.

Referring from product descriptions to previously defined semantic data element type descriptions is the key issue of an effective and secure electronic business. For the relations among data element types, the associated data dictionary and the different specifications see Figure 1.

* Developed by Product Committees, Consortia or other Organizations, e.g. for lifting cranes, capacitors, resistors, power transformers

** Filled with product specific data at a specified time in the life cycle process of a power transformer; used in a defined business scenario among industrial partners, e.g. seller, buyer

Figure 1 – Context of generic specification for information on products

NOTE 1 Such a dictionary is available as a data base application to be found under <http://std.iec.ch/iec61360>

NOTE 2 A test version of the above data base can be found under <http://std.iec.ch/test/61360.nsf>

NOTE 3 As web sites may change along time, the previously given URLs may not be found under the given URL.

Figure 2 shows a business scenario about the usage of a detail specification (based on the generic specification) for information on products between business partners.

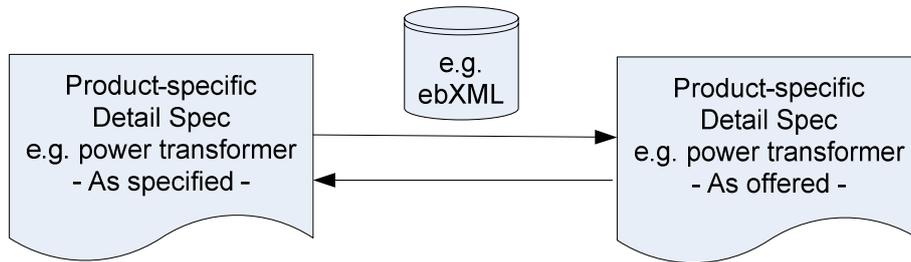

Figure 2 – Business scenario between partners

If a specification for information in the form of an electronic template is associated with a schema for data exchange, e.g. an XML schema or any other tagged electronic file format, the content of the product-specific detail specification can be easily used for import and export of data values in conjunction with data bases for material management systems. See Figure 3.

A specification template can also be imported for the setting up of the internal structures within a data base without having the need to import associated values.

Vice versa detail specifications can be generated to export data using a predefined template based on the generic specification for information on products.

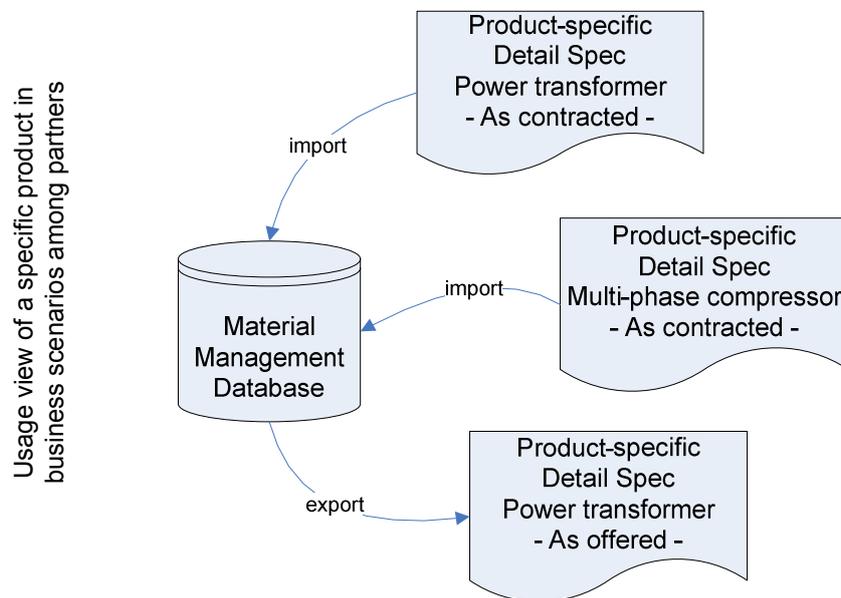

Figure 3 – Import/export possibilities using tagged formats

GENERIC SPECIFICATION OF INFORMATION ON PRODUCTS –

Part 1: Principles and methods

1 Scope

The IEC 62569 series of publications will provide principles and methods for the specification of products by properties, e.g. in data sheets. It uses data element types defined in the data dictionary of IEC 61360.

This PAS provides qualifiers to be used in addition to the properties considering life cycle and other aspects. It is a prerequisite for the other parts of this series.

2 Normative references

The following referenced documents are indispensable for the application of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

IEC 60027 (all parts), *Letter symbols to be used in electrical technology*

IEC 61360-1: 2004, *Standard data element types with associated classification scheme for electric components Part 1: Definitions. Principles and methods*

IEC 81346-1, *Industrial systems, installations and equipment and industrial products - Structuring principles and reference designations*

ISO 31-0:1992, *Quantities and units - Part 0: General principles*

ISO 1000: 1992, *SI units and recommendations for the use of their multiples and of certain other units*

ISO 80000 (all parts), *Quantities and units*
