INTERNATIONAL STANDARD

ISO/IEC 11756

Second edition
1999-06-01

Information technology — Programming languages — M

Technologies de l'information — Langages de programmation — M

Reference number
ISO/IEC 11756:1999(E)

ISO/IEC 11756:1999(E)

Contents

1. Scope	1
2. Normative references	1
3. Conformance	2
3.1 Implementations	2
3.2 Programs	2
4. Definitions	4
5. Metalanguage description	7
6. Routine <u>routine</u>	9
6.1 Routine head <u>routinehead</u>	9
6.2 Routine body <u>routinebody</u>	10
6.2.1 Level line <u>levelline</u>	10
6.2.2 Formal line <u>formalline</u>	10
6.2.3 Label <u>label</u>	10
6.2.4 Label separator <u>ls</u>	11
6.2.5 Line body <u>linebody</u>	11
6.3 Routine execution	11
6.3.1 Transaction processing	12
6.3.2 Error processing	13
6.4 Embedded programs	14
7. Expression <u>expr</u>	15
7.1 Expression atom <u>expratom</u>	15
7.1.1 Variables	15
7.1.2 Variable name <u>glvn</u>	16
7.1.2.1 Local variable name <u>lvn</u>	16
7.1.2.2 Local variable handling	16
7.1.2.3 Process-stack	19
7.1.2.4 Global variable name <u>gvn</u>	20
7.1.3 Structured system variable <u>ssvn</u>	21
7.1.3.1 <u>^\$CHARACTER</u>	21
7.1.3.2 <u>^\$DEVICE</u>	23
7.1.3.3 <u>^\$GLOBAL</u>	23
7.1.3.4 <u>^\$JOB</u>	24
7.1.3.5 <u>^\$LOCK</u>	24
7.1.3.6 <u>^\$ROUTINE</u>	24
7.1.3.7 <u>^\$SYSTEM</u>	25
7.1.3.8 <u>^\$Z[unspecified]</u>	25
7.1.3.9 <u>ssvns</u> specifying default environments	25
7.1.4 Expression item <u>expritem</u>	26

Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work.

In the field of information technology, ISO and IEC have established a joint technical committee, ISO/IEC JTC 1. Draft International Standards adopted by the joint technical committee are circulated to national bodies for voting. Publication as an International Standard requires approval by at least 75% of the national bodies casting a vote.

International Standard ISO/IEC 11756 was prepared by Joint Technical Committee ISO/IEC JTC 1, *Information technology*, Subcommittee 22, *Programming languages, their environments and system software interfaces*.

This second edition cancels and replaces the first edition (ISO/IEC 11756:1992), which has been technically revised.

Annex A forms an integral part of this International Standard. Annexes B to H are for information only.

Introduction

Section 1 consists of nine clauses that describe the MUMPS language. Clause 1 describes the metalanguage used in the remainder of Section 1 for the static syntax. The remaining clauses describe the static syntax and overall semantics of the language. The distinction between "static" and "dynamic" syntax is as follows. The static syntax describes the sequence of characters in a routine as it appears on a tape in routine interchange or on a listing. The dynamic syntax describes the sequence of characters that would be encountered by an interpreter during execution of the routine. (There is no requirement that MUMPS actually be interpreted). The dynamic syntax takes into account transfers of control and values produced by indirection.

Clauses 10 through 21 highlight, for the benefit of implementors and application programmers, aspects of the language that must be accorded special attention if M program transferability (i.e., portability of source code between various M implementations) is to be achieved. It provides a specification of limits that must be observed by both implementors and programmers if portability is not to be ruled out. To this end, implementors must meet or exceed these limits, treating them as a minimum requirement. Any implementor who provides definitions in currently undefined areas must take into account that this action risks jeopardizing the upward compatibility of the implementation, upon subsequent revision of the M Language Specification. Application programmers striving to develop portable programs must take into account the danger of employing "unilateral extensions" to the language made available by the implementor.

The following definitions apply to the use of the terms *explicit limit* and *implicit limit* within this document. An explicit limit is one which applies directly to a referenced language construct. Implicit limits on language constructs are second-order effects resulting from explicit limits on other language constructs. For example, the explicit command line length restriction places an implicit limit on the length of any construct which must be expressed entirely within a single command line.

Clauses 22 through 24 describe the binding between M and ANSI X3.64. ANSI X3.64 is a functional standard for additional control functions for data interchange with two-dimensional character-imaging input and/or output devices. It is an ANSI standard, but also an ISO standard with roughly similar characteristics exists (ISO 2022). As such, it has been implemented in many devices worldwide. It is expected that M can be easily adapted to these implementations.

The standard defined as ANSI X3.64 defines a format for device-control. No physical device is required to be able to perform all possible control-functions. In reality, as some functions rely on certain physical properties of specific devices, no device will be able to perform all functions. The standard, however, does not specify which functions a device should be able to do, but if it is able to perform a function, how the control-information for this function is to be specified.

This binding is to the functional definitions included in X3.64. The actual dialogue between the M implementation and the device is left to the implementor.

Information technology- Programming languages - M

1. Scope

This International Standard describes the M programming language.

2. Normative references

The following standards contain provisions which, through reference in this text, constitute provisions of this International Standard. At the time of publication, the editions indicated were valid. All standards are subject to revision, and parties to agreements based on this International Standard are encouraged to investigate the possibility of applying the most recent editions of the standards indicated below. Members of IEC and ISO maintain registers of the currently valid International Standards.

ISO/IEC 9075:1992, Information technology -- Database languages -- SQL

ANSI X3.4-1990, (ASCII Character Set)

ANSI X3.64-1979, R1990 (ANSI Terminal Device Control Mnemonics)
