Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work. In the field of information technology, ISO and IEC have established a joint technical committee, ISO/IEC JTC 1.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of the joint technical committee is to prepare International Standards. Draft International Standards adopted by the joint technical committee are circulated to national bodies for voting. Publication as an International Standard requires approval by at least 75 % of the national bodies casting a vote.

ISO/IEC 14496-20 was prepared by Joint Technical Committee ISO/IEC JTC 1, Information technology, Subcommittee SC 29, Coding of audio, picture, multimedia and hypermedia information.

ISO/IEC 14496 consists of the following parts, under the general title Information technology — Coding of audio-visual objects:

— Part 1: Systems
— Part 2: Visual
— Part 3: Audio
— Part 4: Conformance testing
— Part 5: Reference software
— Part 6: Delivery Multimedia Integration Framework (DMIF)
— Part 7: Optimized reference software for coding of audio-visual objects [Technical Report]
— Part 8: Carriage of ISO/IEC 14496 contents over IP networks
— Part 10: Advanced Video Coding
— Part 11: Scene description and application engine
— Part 12: ISO base media file format
— Part 14: MP4 file format
— Part 15: Advanced Video Coding (AVC) file format
— Part 16: Animation Framework eXtension (AFX)
— Part 17: Streaming text format
— Part 18: Font compression and streaming

— Part 19: Synthesized texture stream
— Part 20: Lightweight Application Scene Representation (LASeR) and Simple Aggregation Format (SAF)
— Part 21: MPEG-J Graphics Framework eXtensions (GFX)
— Part 22: Open Font Format
— Part 23: Symbolic Music Representation
— Part 24: Audio and systems interaction [Technical Report]
— Part 25: 3D Graphics Compression model
Introduction

ISO/IEC 14496-20 specifies syntax and semantics for the following:

— The Lightweight Application Scene Representation (LASeR), specified in Clause 6, which is a binary format for encoding 2D scenes and updates of scenes. The binary format and the scene representation (based on SVG Tiny) are both designed to be suitable for lightweight embedded devices such as mobile phones.

— A Simple Aggregation Format (SAF), specified in Clause 7, to efficiently and easily transport LASeR data together with audio and/or video content over various delivery channels. This multiplexing scheme is designed to be simple to implement and to allow efficient demultiplexing on low-end devices.

The International Organization for Standardization (ISO) and International Electrotechnical Commission (IEC) draw attention to the fact that it is claimed that compliance with this document may involve the use of a patent.

ISO and IEC take no position concerning the evidence, validity and scope of this patent right.

The holder of this patent right has assured ISO and IEC that he is willing to negotiate licences under reasonable and non-discriminatory terms and conditions with applicants throughout the world. In this respect, the statement of the holder of this patent right is registered with ISO and IEC. Information may be obtained from the companies listed in Annex A.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights other than those identified in Annex A. ISO and IEC shall not be held responsible for identifying any or all such patent rights.
Information technology — Coding of audio-visual objects —

Part 20: Lightweight Application Scene Representation (LASeR) and Simple Aggregation Format (SAF)

1 Scope

This part of ISO/IEC 14496 defines a scene description format (LASeR) and an aggregation format (SAF) respectively suitable for representing and delivering rich-media services to resource-constrained devices such as mobile phones.

LASeR aims at fulfilling all the requirements of rich-media services at the scene description level. LASeR supports

— an optimized set of objects inherited from SVG to describe rich-media scenes,
— a small set of key compatible extensions over SVG,
— the ability to encode and transmit a LASeR stream and then reconstruct SVG content,
— dynamic updating of the scene to achieve a reactive, smooth and continuous service,
— simple yet efficient compression to improve delivery and parsing times, as well as storage size, one of the design goals being to allow both for a direct implementation of the SDL as documented, as well as for a decoder compliant with ISO/IEC 23001-1 to decode the LASeR bitstream,
— an efficient interface with audio and visual streams with frame-accurate synchronization,
— use of any font format, including the OpenType industry standard, and
— easy conversion from other popular rich-media formats in order to leverage existing content and developer communities.

Technology selection criteria for LASeR included compression efficiency, but also code and memory footprint and performance. Other aims included: scalability, adaptability to the user context, extensibility of the format, ability to define small profiles, feasibility of a J2ME implementation, error resilience and safety of implementations.

SAF aims at fulfilling all the requirements of rich-media services at the interface between media/scene description and existing transport protocols:

— simple aggregation of any type of stream,
— signalling of MPEG and non-MPEG streams,
— optimized packet headers for bandwidth-limited networks,
— easy mapping to popular streaming formats,
— cache management capability, and
— extensibility.

SAF has been designed to complement LASeR for simple, interactive services, bringing
— efficient and dynamic packaging to cope with high latency networks,
— media interleaving, and
— synchronization support with a very low overhead.

This part of ISO/IEC 14496 defines the usage of SAF for LASeR content; however, LASeR can be used independently from SAF.

3 Terms, definitions and abbreviations

3.1 Terms and definitions

For the purposes of this document, the following terms, definitions and abbreviations apply.

3.1.1 access unit
individual accessible portion of data within a media stream

NOTE An access unit is the smallest data entity to which timing information can be attributed.

3.1.2 media time line
axis on which times are expressed within the transport or system carrying a LASeR or other stream

3.1.3 normal play time
indicates the stream absolute position relative to the beginning of the presentation

[IETF RFC 2326]

3.1.4 packet
smallest data entity managed by SAF consisting of a header and a payload

3.1.5 scene segment
set of access units of a LASeR stream, where only the first access unit contains a LASeRHeader

3.1.6 scene time line
axis on which times are expressed within the SVG/LASeR scene, e.g. begin and end

3.1.7 waiting tree
separate tree defined in addition to the scene tree

NOTE The compositor and renderer have no knowledge of the waiting tree, thus objects in the waiting tree are neither composited nor rendered.
