Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work. In the field of information technology, ISO and IEC have established a joint technical committee, ISO/IEC JTC 1.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of document should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO and IEC shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see the following URL: www.iso.org/iso/foreword.html.

This document was prepared by the GS1 and was adopted, under the PAS procedure, by Joint Technical Committee ISO/IEC JTC 1, Information technology, in parallel with its approval by national bodies of ISO and IEC.

This second edition cancels and replaces the first edition (ISO/IEC 19987:2015), which has been technically revised.

The main changes compared to the previous edition are as follows:

- A mechanism is introduced to declare that a prior EPCIS event is in error, for use when it is impossible to correct the historical trace by means of ordinary EPCIS events.
- An optional eventID is added to all EPCIS events.
- The Simple Event Query is enhanced to clarify that queries for extension or ILMD fields apply only to top-level XML elements, and a new set of query parameters is introduced to query for XML elements nested within top-level elements.
- The role of an EPCIS document as a means to transmit events point-to-point is clarified.

- The EPCIS Header in the XML schemas is enhanced to allow for optional inclusion of master data.
- The use of extension elements within <readPoint> and <bizLocation> is deprecated.
- Section 12 regarding conformance is added.

Document Summary

Document Item	Current Value
Document Name	EPC Information Services (EPCIS) Standard
Document Date	Sep 2016
Document Version	1.2
Document Issue	
Document Status	Ratified
Document Description	enables disparate applications to create and share visibility event data, both within and across enterprises.

Log of Changes

Release	Date of Change	Changed By	Summary of Change
1.0			Initial version
1.1	May 2014		<p>EPCIS 1.1 is fully backward compatible with EPCIS 1.0.1.</p> <p>EPCIS 1.1 includes these new or enhanced features:</p> <p>Support for class-level identification is added to <code>ObjectEvent</code>, <code>AggregationEvent</code>, and <code>TransformationEvent</code> through the addition of quantity lists.</p> <p>A new event type, <code>TransformationEvent</code>, provides for the description of events in which inputs are consumed and outputs are produced.</p> <p>The “why” dimension of all event types are enhanced so that information about the sources and destinations of business transfers may be included.</p> <p>The “why” dimension of certain event types are enhanced so that item/lot master data may be included.</p> <p>The <code>SimpleEventQuery</code> is enhanced to encompass the above changes to event types.</p> <p>The introductory material is revised to align with the GS1 System Architecture.</p> <p>The XML extension mechanism is explained more fully.</p> <p>The <code>QuantityEvent</code> is deprecated, as its functionality is fully subsumed by <code>ObjectEvent</code> with the addition of quantity lists.</p>

Release	Date of Change	Changed By	Summary of Change
1.2	Sep 2016		<p>EPCIS 1.2 is fully backward compatible with EPCIS 1.1 and 1.0.1.</p> <p>EPCIS 1.2 includes these new or enhanced features:</p> <p>A mechanism is introduced to declare that a prior EPCIS event is in error, for use when it is impossible to correct the historical trace by means of ordinary EPCIS events. This mechanism includes the <code>errorDeclaration</code> structure in an EPCIS event and associated query parameters.</p> <p>An optional <code>eventID</code> is added to all EPCIS events. Its main intended use is to allow for an error declaration event to (optionally) refer to one or more corrective events.</p> <p>The Simple Event Query is enhanced to clarify that queries for extension or ILM fields apply only to top-level XML elements, and a new set of query parameters is introduced to query for XML elements nested within top-level elements.</p> <p>The role of an EPCIS document as a means to transmit events point-to-point is clarified.</p> <p>The EPCIS Header in the XML schemas is enhanced to allow for optional inclusion of master data.</p> <p>The use of extension elements within <code><readPoint></code> and <code><bizLocation></code> is deprecated.</p> <p>Section 12 regarding conformance is added.</p>

Disclaimer

GS1®, under its IP Policy, seeks to avoid uncertainty regarding intellectual property claims by requiring the participants in the Work Group that developed this **EPC Information Services (EPCIS) Standard** to agree to grant to GS1 members a royalty-free licence or a RAND licence to Necessary Claims, as that term is defined in the GS1 IP Policy. Furthermore, attention is drawn to the possibility that an implementation of one or more features of this Specification may be the subject of a patent or other intellectual property right that does not involve a Necessary Claim. Any such patent or other intellectual property right is not subject to the licencing obligations of GS1. Moreover, the agreement to grant licences provided under the GS1 IP Policy does not include IP rights and any claims of third parties who were not participants in the Work Group.

Accordingly, GS1 recommends that any organisation developing an implementation designed to be in conformance with this Specification should determine whether there are any patents that may encompass a specific implementation that the organisation is developing in compliance with the Specification and whether a licence under a patent or other intellectual property right is needed. Such a determination of a need for licencing should be made in view of the details of the specific system designed by the organisation in consultation with their own patent counsel.

1 Introduction

This document is a GS1 standard that defines Version 1.2 of EPC Information Services (EPCIS). The goal of EPCIS is to enable disparate applications to create and share visibility event data, both within and across enterprises. Ultimately, this sharing is aimed at enabling users to gain a shared view of physical or digital objects within a relevant business context.

“Objects” in the context of EPCIS typically refers to physical objects that are identified either at a class or instance level and which are handled in physical handling steps of an overall business process involving one or more organisations. Examples of such physical objects include trade items (products), logistic units, returnable assets, fixed assets, physical documents, etc. “Objects” may also refer to digital objects, also identified at either a class or instance level, which participate in comparable business process steps. Examples of such digital objects include digital trade items (music downloads, electronic books, etc.), digital documents (electronic coupons, etc.), and so forth. Throughout this document the word “object” is used to denote a physical or digital object, identified at a class or instance level, that is the subject of a business process step. EPCIS data consist of “visibility events,” each of which is the record of the completion of a specific business process step acting upon one or more objects.

The EPCIS standard was originally conceived as part of a broader effort to enhance collaboration between trading partners by sharing of detailed information about physical or digital objects. The name EPCIS reflects the origins of this effort in the development of the Electronic Product Code (EPC). It should be noted, however, that EPCIS does not require the use of Electronic Product Codes, nor of Radio-Frequency Identification (RFID) data carriers, and as of EPCIS 1.2 does not even require instance-level identification (for which the Electronic Product Code was originally designed). The EPCIS standard applies to all situations in which visibility event data is to be captured and shared, and the presence of “EPC” within the name is of historical significance only.

EPCIS provides open, standardised interfaces that allow for seamless integration of well-defined services in inter-company environments as well as within companies. Standard interfaces are defined in the EPCIS standard to enable visibility event data to be captured and queried using a defined set of service operations and associated data standards, all combined with appropriate security mechanisms that satisfy the needs of user companies. In many or most cases, this will involve the use of one or more persistent databases of visibility event data, though elements of the Services approach could be used for direct application-to-application sharing without persistent databases.

With or without persistent databases, the EPCIS specification specifies only a standard data sharing interface between applications that capture visibility event data and those that need access to it. *It does not specify how the service operations or databases themselves should be implemented.* This includes not defining how the EPCIS services should acquire and/or compute the data they need, except to the extent the data is captured using the standard EPCIS capture operations. The interfaces are needed for interoperability, while the implementations allow for competition among those providing the technology and implementing the standard.

EPCIS is intended to be used in conjunction with the GS1 Core Business Vocabulary (CBV) standard [CBV1.2]. The CBV standard provides definitions of data values that may be used to populate the data structures defined in the EPCIS standard. The use of the standardised vocabulary provided by the CBV standard is critical to interoperability and critical to provide for querying of data by reducing the variation in how different businesses express common intent. Therefore, applications should use the CBV standard to the greatest extent possible in constructing EPCIS data.

The companion EPCIS and CBV Implementation Guideline [EPCISGuideline] provides additional guidance for building visibility systems using EPCIS and CBV, including detailed discussion of how to model specific business situations using EPCIS/CBV data and methods for sharing such data between trading partners.
