Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work. In the field of information technology, ISO and IEC have established a joint technical committee, ISO/IEC JTC 1.

IEEE Standards documents are developed within the IEEE Societies and the Standards Coordinating Committees of the IEEE Standards Association (IEEE-SA) Standards Board. The IEEE develops its standards through a consensus development process, approved by the American National Standards Institute, which brings together volunteers representing varied viewpoints and interests to achieve the final product. Volunteers are not necessarily members of the Institute and serve without compensation. While the IEEE administers the process and establishes rules to promote fairness in the consensus development process, the IEEE does not independently evaluate, test, or verify the accuracy of any of the information contained in its standards.

The main task of ISO/IEC JTC 1 is to prepare International Standards. Draft International Standards adopted by the joint technical committee are circulated to national bodies for voting. Publication as an International Standard requires approval by at least 75 % of the national bodies casting a vote.

Attention is called to the possibility that implementation of this standard may require the use of subject matter covered by patent rights. By publication of this standard, no position is taken with respect to the existence or validity of any patent rights in connection therewith. ISO/IEEE is not responsible for identifying essential patents or patent claims for which a license may be required, for conducting inquiries into the legal validity or scope of patents or patent claims or determining whether any licensing terms or conditions provided in connection with submission of a Letter of Assurance or a Patent Statement and Licensing Declaration Form, if any, or in any licensing agreements are reasonable or non-discriminatory. Users of this standard are expressly advised that determination of the validity of any patent rights, and the risk of infringement of such rights, is entirely their own responsibility. Further information may be obtained from ISO or the IEEE Standards Association.

ISO/IEC/IEEE 18880 was prepared by the Corporate Advisory Group of the IEEE SA Board of Governors (as IEEE 1888:2014). It was adopted by Joint Technical Committee ISO/IEC JTC 1, *Information technology*, Subcommittee SC 6, *Telecommunications and information exchange between systems*, in parallel with its approval by the ISO/IEC national bodies, under the “fast-track procedure” defined in the Partner Standards Development Organization cooperation agreement between ISO and IEEE. IEEE is responsible for the maintenance of this document with participation and input from ISO/IEC national bodies.

IEEE Standard for Ubiquitous Green Community Control Network Protocol

IEEE-SA Board of Governors

Sponsored by the
Corporate Advisory Group

IEEE Std 1888™-2014

(Revision of
IEEE Std 1888-2011)

IEEE Standard for Ubiquitous Green Community Control Network Protocol

IEEE-SA Board of Governors

Sponsored by the
Corporate Advisory Group

Approved 27 March 2014

IEEE-SA Standards Board

Abstract: The standard identifies gateways for field-bus networks, data storage for archiving and developing data sharing platforms, and application units as important system components for developing digital communities, i.e., building-scale and city-wide ubiquitous facility networking infrastructure. The standard defines a data exchange protocol that generalizes and interconnects these components (gateways, storage, application units) over the IPv4/v6-based networks. This enables integration of multiple facilities, data storage, application services such as central management, energy saving, environmental monitoring, and alarm notification systems.

Keywords: access interface, actuator, APP, application, communication protocol, component, data structure, energy management, energy saving, facility networking, gateway, GW, IEEE 1888™, point, registry, sensor, SOAP, storage

Important Notices and Disclaimers Concerning IEEE Standards Documents

IEEE documents are made available for use subject to important notices and legal disclaimers. These notices and disclaimers, or a reference to this page, appear in all standards and may be found under the heading “Important Notice” or “Important Notices and Disclaimers Concerning IEEE Standards Documents.”

Notice and Disclaimer of Liability Concerning the Use of IEEE Standards Documents

IEEE Standards documents (standards, recommended practices, and guides), both full-use and trial-use, are developed within IEEE Societies and the Standards Coordinating Committees of the IEEE Standards Association (“IEEE-SA”) Standards Board. IEEE (“the Institute”) develops its standards through a consensus development process, approved by the American National Standards Institute (“ANSI”), which brings together volunteers representing varied viewpoints and interests to achieve the final product. Volunteers are not necessarily members of the Institute and participate without compensation from IEEE. While IEEE administers the process and establishes rules to promote fairness in the consensus development process, IEEE does not independently evaluate, test, or verify the accuracy of any of the information or the soundness of any judgments contained in its standards.

IEEE does not warrant or represent the accuracy or content of the material contained in its standards, and expressly disclaims all warranties (express, implied and statutory) not included in this or any other document relating to the standard, including, but not limited to, the warranties of: merchantability; fitness for a particular purpose; non-infringement; and quality, accuracy, effectiveness, currency, or completeness of material. In addition, IEEE disclaims any and all conditions relating to: results; and workmanlike effort. IEEE standards documents are supplied “AS IS” and “WITH ALL FAULTS.”

Use of an IEEE standard is wholly voluntary. The existence of an IEEE standard does not imply that there are no other ways to produce, test, measure, purchase, market, or provide other goods and services related to the scope of the IEEE standard. Furthermore, the viewpoint expressed at the time a standard is approved and issued is subject to change brought about through developments in the state of the art and comments received from users of the standard.

In publishing and making its standards available, IEEE is not suggesting or rendering professional or other services for, or on behalf of, any person or entity nor is IEEE undertaking to perform any duty owed by any other person or entity to another. Any person utilizing any IEEE Standards document, should rely upon his or her own independent judgment in the exercise of reasonable care in any given circumstances or, as appropriate, seek the advice of a competent professional in determining the appropriateness of a given IEEE standard.

IN NO EVENT SHALL IEEE BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO: PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE PUBLICATION, USE OF, OR RELIANCE UPON ANY STANDARD, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE AND REGARDLESS OF WHETHER SUCH DAMAGE WAS FORESEEABLE.

Translations

The IEEE consensus development process involves the review of documents in English only. In the event that an IEEE standard is translated, only the English version published by IEEE should be considered the approved IEEE standard.

Official statements

A statement, written or oral, that is not processed in accordance with the IEEE-SA Standards Board Operations Manual shall not be considered or inferred to be the official position of IEEE or any of its committees and shall not be considered to be, or be relied upon as, a formal position of IEEE. At lectures, symposia, seminars, or educational courses, an individual presenting information on IEEE standards shall make it clear that his or her views should be considered the personal views of that individual rather than the formal position of IEEE.

Comments on standards

Comments for revision of IEEE Standards documents are welcome from any interested party, regardless of membership affiliation with IEEE. However, IEEE does not provide consulting information or advice pertaining to IEEE Standards documents. Suggestions for changes in documents should be in the form of a proposed change of text, together with appropriate supporting comments. Since IEEE standards represent a consensus of concerned interests, it is important that any responses to comments and questions also receive the concurrence of a balance of interests. For this reason, IEEE and the members of its societies and Standards Coordinating Committees are not able to provide an instant response to comments or questions except in those cases where the matter has previously been addressed. For the same reason, IEEE does not respond to interpretation requests. Any person who would like to participate in revisions to an IEEE standard is welcome to join the relevant IEEE working group.

Comments on standards should be submitted to the following address:

Secretary, IEEE-SA Standards Board
445 Hoes Lane
Piscataway, NJ 08854 USA

Laws and regulations

Users of IEEE Standards documents should consult all applicable laws and regulations. Compliance with the provisions of any IEEE Standards document does not imply compliance to any applicable regulatory requirements. Implementers of the standard are responsible for observing or referring to the applicable regulatory requirements. IEEE does not, by the publication of its standards, intend to urge action that is not in compliance with applicable laws, and these documents may not be construed as doing so.

Copyrights

IEEE draft and approved standards are copyrighted by IEEE under U.S. and international copyright laws. They are made available by IEEE and are adopted for a wide variety of both public and private uses. These include both use, by reference, in laws and regulations, and use in private self-regulation, standardization, and the promotion of engineering practices and methods. By making these documents available for use and adoption by public authorities and private users, IEEE does not waive any rights in copyright to the documents.

Photocopies

Subject to payment of the appropriate fee, IEEE will grant users a limited, non-exclusive license to photocopy portions of any individual standard for company or organizational internal use or individual, non-commercial use only. To arrange for payment of licensing fees, please contact Copyright Clearance Center, Customer Service, 222 Rosewood Drive, Danvers, MA 01923 USA; +1 978 750 8400. Permission to photocopy portions of any individual standard for educational classroom use can also be obtained through the Copyright Clearance Center.

Updating of IEEE Standards documents

Users of IEEE Standards documents should be aware that these documents may be superseded at any time by the issuance of new editions or may be amended from time to time through the issuance of amendments, corrigenda, or errata. An official IEEE document at any point in time consists of the current edition of the document together with any amendments, corrigenda, or errata then in effect.

Every IEEE standard is subjected to review at least every ten years. When a document is more than ten years old and has not undergone a revision process, it is reasonable to conclude that its contents, although still of some value, do not wholly reflect the present state of the art. Users are cautioned to check to determine that they have the latest edition of any IEEE standard.

In order to determine whether a given document is the current edition and whether it has been amended through the issuance of amendments, corrigenda, or errata, visit the IEEE-SA Website at <http://ieeexplore.ieee.org/xpl/standards.jsp> or contact IEEE at the address listed previously. For more information about the IEEE-SA or IEEE's standards development process, visit the IEEE-SA Website at <http://standards.ieee.org>.

Errata

Errata, if any, for all IEEE standards can be accessed on the IEEE-SA Website at the following URL: <http://standards.ieee.org/findstds/errata/index.html>. Users are encouraged to check this URL for errata periodically.

Patents

Attention is called to the possibility that implementation of this standard may require use of subject matter covered by patent rights. By publication of this standard, no position is taken by the IEEE with respect to the existence or validity of any patent rights in connection therewith. If a patent holder or patent applicant has filed a statement of assurance via an Accepted Letter of Assurance, then the statement is listed on the IEEE-SA Website at <http://standards.ieee.org/about/sasb/patcom/patents.html>. Letters of Assurance may indicate whether the Submitter is willing or unwilling to grant licenses under patent rights without compensation or under reasonable rates, with reasonable terms and conditions that are demonstrably free of any unfair discrimination to applicants desiring to obtain such licenses.

Essential Patent Claims may exist for which a Letter of Assurance has not been received. The IEEE is not responsible for identifying Essential Patent Claims for which a license may be required, for conducting inquiries into the legal validity or scope of Patents Claims, or determining whether any licensing terms or conditions provided in connection with submission of a Letter of Assurance, if any, or in any licensing agreements are reasonable or non-discriminatory. Users of this standard are expressly advised that determination of the validity of any patent rights, and the risk of infringement of such rights, is entirely their own responsibility. Further information may be obtained from the IEEE Standards Association.

Participants

At the time this IEEE standard was submitted to the IEEE-SA Standards Board for approval, the UGCCNet Working Group had the following membership:

Beijing Jiaotong University
BII Group Holdings Ltd.
China Telecommunications
Corporation

Cisco Systems, Inc.
Intel Corporation

Qingdao Gaoxiao Information
Industry Co. Ltd.
The University of Tokyo

The P1888 Working Group gratefully acknowledges the contributions of the following participants. Without their assistance and dedication, this standard would not have been completed.

Dong Liu, *Chair*

Hiroshi Esaki
Ming Feng
Shuai Gao
Chen Gu
Xiaochuan Gu

Lianshan Jiang
Wenjie Li
Hideya Ochiai
Shoichi Sakane
Yang Song
Guoquan Tan

Xiuying Tan
Hongke Zhang
Huiling Zhao
Xiaopeng Zhao
Ning Zou

The following members of the entity balloting committee voted on this standard. Balloters may have voted for approval, disapproval, or abstention.

Beijing Jiaotong University
Beijing University of Posts and
Telecommunications (BUPT)
BII Group Holdings Ltd.
China Datang Corporation
China Telecommunications
Corporation
Cisco Systems, Inc.

Guangzhou Smart Home
Technology Standards
Promotion Center

Telephone Corporation (NTT)

Qingdao Gaoxiao Information
Industry Co. Ltd.
Raisecom Technology Co., Ltd.
Renesas Electronics Corporation
State Grid Corporation of China
(SGCC)
The University of Tokyo
ZTE Corporation

When the IEEE-SA Standards Board approved this standard on 27 March 2014, it had the following membership:

John Kulick, *Chair*
Jon Walter Rosdahl, *Vice-chair*
Richard H. Hulett, *Past Chair*
Konstantinos Karachalios, *Secretary*

Peter Balma
 Farooq Bari
 Ted Burse
 Clint Chaplain
 Stephen Dukes
 Jean-Phillippe Faure
 Gary Hoffman

Michael Janezic
 Jeffrey Katz
 Joseph L. Koepfinger*
 David J. Law
 Hung Ling
 Oleg Logvinov
 Ted Olsen
 Glenn Parsons

Ron Peterson
 Adrian Stephens
 Peter Sutherland
 Yatin Trivedi
 Phil Winston
 Don Wright
 Yu Yuan

*Member Emeritus

Also included are the following nonvoting IEEE-SA Standards Board liaisons:

Richard DeBlasio, *DOE Representative*
 Michael Janezic, *NIST Representative*

Don Messina
IEEE Standards Program Manager, Document Development

Joan Woolery
IEEE Standards Program Manager, Technical Program Development

Introduction

This introduction is not part of IEEE Std 1888-2014, IEEE Standard for Ubiquitous Green Community Control Network Protocol.

The standard identifies gateways for field-bus networks, data storage for archiving and developing data sharing platforms, and application units to be important system components for developing digital communities, i.e., building-scale and city-wide ubiquitous facility networking infrastructure. The standard defines a data exchange protocol that generalizes and interconnects these components (gateways, storage, application units) over the IPv4/v6-based networks. This enables integration of multiple facilities, data storage, application services such as central management, energy saving, environmental monitoring, and alarm notification systems.

Facility networking in buildings, houses, and factories is now considered to be a promising tool for energy management or energy saving, and networking of facilities with TCP/IP protocols has certainly enabled building-scale or city-wide energy management. However, most of the systems are proprietarily and independently developed, deployed, and operated, which makes the installation and running costs quite high.

Traditionally, in order to extend access reachability to sensors and actuators at the field-bus level via the Internet, gateway design has been introduced. However, recent applications of facility networking for such scales are required beyond just a simple access to devices. In most of the practical implementations, they have (1) large storage to archive the history of sensor readings, (2) user interface for interactive operation, (3) reporting systems, and (4) a data analyzer.

Collaboration of these system components is mandatory, especially in energy-aware facility networking. However, they cannot simply collaborate or interoperate with each other without understanding the intended analysis, integration, and operation of systems, because these system components have been independently developed and proprietarily integrated.

Interoperability of these system components by a common communication protocol certainly increases the efficiency of facility networking deployment. It reduces the cost of system integration and interoperability management, allowing installation of them in small and medium-sized buildings and even houses. For vendors, their developed components can be sold worldwide without any customized implementation, sometimes resulting in mass production with reasonable cost.

Targeting building-scale and city-wide energy management, the IEEE P1888 Working Group initiated the project named Ubiquitous Green Community Control Network (UGCCNet), which specifies integration architecture of remote facilities. The scope and purpose of this project is to establish facility networking infrastructure over the Internet by specifying an interoperable communication protocol among the common (building-scale) facility networking components (i.e., device access gateways, data storage, and application units). This standard specifies UGCCNet in order to allow interoperability and open development of those facility networking components. First, the standard generalizes all the facility networking components by a simple component model. Then, the standard defines communication protocol among them. The standard also introduces a registry mechanism to support autonomous collaboration of these components.

It is a communication infrastructure that aims to construct a new network for the renewal of the facilities, next generation's facility management, and the energy conservation including small and medium-sized facilities. The aspect is expanded from a past facility management to the operation management that targets energy conservation and the integration of the management platform. This infrastructure will be used for some system-level collaborations in addition to the energy conservation.

IEEE Standard for Ubiquitous Green Community Control Network Protocol

IMPORTANT NOTICE: *IEEE Standards documents are not intended to ensure safety, security, health, or environmental protection, or ensure against interference with or from other devices or networks. Implementers of IEEE Standards documents are responsible for determining and complying with all appropriate safety, security, environmental, health, and interference protection practices and all applicable laws and regulations.*

This IEEE document is made available for use subject to important notices and legal disclaimers. These notices and disclaimers appear in all publications containing this document and may be found under the heading “Important Notice” or “Important Notices and Disclaimers Concerning IEEE Documents.” They can also be obtained on request from IEEE or viewed at <http://standards.ieee.org/IPR/disclaimers.html>.

1. Overview

1.1 Scope

The standard identifies gateways for field-bus networks, data storage for archiving and developing data sharing platforms, and application units such as those providing user interfaces of analysis and for knowing that environmental information is an important system component for developing digital communities, i.e., building-scale and city-wide ubiquitous facility networking infrastructure. The standard defines a data exchange protocol that generalizes and interconnects these components (gateways, storage, application units) over the IPv4/v6-based networks. This opens the application interface to handle the statuses of multi-vendor facilities on a generalized digital infrastructure. The standard assumes distributed operation of the infrastructure by multiple service providers and integrators, and defines a component management protocol that autonomously interoperates such distributed infrastructure. Security requirements are taken into consideration in this standard to ensure the integrity and confidentiality of data.

1.2 Purpose

The standard aims to develop green communities whose energy usage is well managed and highly efficient, by allowing the interconnection of facilities of multiple buildings including small and medium-sized on different converged networks, data sharing platforms, and application units. The products based on the standard implement the functions of sensing, archiving, sharing and presenting of ubiquitous information such as power usage and generation, environmental status and signals, human behavior, heating, ventilation, and air conditioning (HVAC) working status, lighting systems, weather, warnings, analyzed data, forecasted data, and so on. With the capability of interoperable integration of these system

components, the standard aims to provide and share rich data platforms, including cooperation with control-oriented systems.

2. Normative references
