## Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see [www.iso.org/directives](http://www.iso.org/directives)).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see [www.iso.org/patents](http://www.iso.org/patents)).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see [www.iso.org/iso/foreword.html](http://www.iso.org/iso/foreword.html).

This document was prepared by Technical Committee ISO/TC 229, *Nanotechnologies*, in collaboration with Technical Committee IEC/TC 113, *Nanotechnology for electrotechnical products and systems* and with the European Committee for Standardization (CEN) Technical Committee CEN/TC 352, *Nanotechnologies*, in accordance with the Agreement on technical cooperation between ISO and CEN (Vienna Agreement).

This second edition cancels and replaces the first edition (ISO/TS 80004-6:2013), which has been technically revised throughout.

A list of all parts in the ISO/TS 80004 series can be found on the ISO website.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at [www.iso.org/members.html](http://www.iso.org/members.html).

## Introduction

Measurement and instrumentation techniques have effectively opened the door to modern nanotechnology. Characterization is key to understanding the properties and function of all nano-objects.

Nano-object characterization involves interactions between people with different backgrounds and from different fields. Those interested in nano-object characterization might, for example, be materials scientists, biologists, chemists or physicists, and might have a background that is primarily experimental or theoretical. Those making use of the data extend beyond this group to include regulators and toxicologists. To avoid any misunderstandings, and to facilitate both comparability and the reliable exchange of information, it is essential to clarify the concepts, to establish the terms for use and to establish their definitions.

The terms are classified under the following broad headings:

- [Clause 3](#): General terms;
- [Clause 4](#): Terms related to size and shape measurement;
- [Clause 5](#): Terms related to chemical analysis;
- [Clause 6](#): Terms related to measurement of other properties.

These headings are intended as a guide only, as some techniques can determine more than one property. Subclause [4.1](#) lists the overarching measurands that apply to the rest of [Clause 4](#). Other measurands are more technique-specific and are placed in the text adjacent to the technique.

It should be noted that most techniques require analysis in a non-native state and involve sample preparation, e.g. placing the nano-objects on a surface or placing them in a specific fluid or vacuum. This could change the nature of the nano-objects.

The order of the techniques in this document should not be taken to indicate a preference and the techniques listed in this document are not intended to be exhaustive. Equally, some of the techniques listed in this document are more popular than others in their usage in analysing certain properties of nano-objects. [Table 1](#) lists alphabetically the common techniques for nano-object characterization.

Subclause [4.5](#) provides definitions of microscopy methods and related terms. When abbreviated terms are used, note that the final “M”, given as “microscopy”, can also mean “microscope” depending on the context. For definitions relating to the microscope, the word “method” can be replaced by the word “instrument” where that appears.

[Clause 5](#) provides definitions of terms related to chemical analysis. For these abbreviated terms, note that the final “S”, given as “spectroscopy”, can also mean “spectrometer” depending on the context. For definitions relating to the spectrometer, the word “method” can be replaced by the word “instrument” where that appears.

This document is intended to serve as a starting reference for the vocabulary that underpins measurement and characterization efforts in the field of nanotechnologies.

**Table 1 — Alphabetical list of the common techniques for nano-object characterization**

| <b>Property</b>                         | <b>Common techniques</b>   |
|---|--|
| Size                                    | centrifugal liquid sedimentation (CLS)<br>atomic-force microscopy (AFM)<br>differential mobility analysing system (DMAS)<br>dynamic light scattering (DLS)<br>variants of inductively coupled plasma mass spectrometry (ICP-MS)<br>particle tracking analysis (PTA)<br>scanning electron microscopy (SEM)<br>small-angle X-ray scattering (SAXS)<br>transmission electron microscopy (TEM) |
| Shape                                   | atomic-force microscopy (AFM)<br>scanning electron microscopy (SEM)<br>transmission electron microscopy (TEM)  |
| Surface area                            | Brunauer–Emmett–Teller (BET) method  |
| “Surface” chemistry                     | Raman spectroscopy<br>secondary-ion mass spectrometry (SIMS)<br>X-ray photoelectron spectroscopy (XPS)   |
| Chemistry of the “bulk” sample          | energy-dispersive X-ray spectroscopy (EDX)<br>inductively coupled plasma mass spectrometry (ICP-MS)<br>nuclear magnetic resonance (NMR) spectroscopy   |
| Crystallinity                           | selected area electron diffraction (SAED)<br>X-ray diffraction (XRD)   |
| Electrokinetic potential in suspensions | electrophoretic mobility   |

# Nanotechnologies — Vocabulary —

## Part 6: Nano-object characterization

### 1 Scope

This document defines terms related to the characterization of nano-objects in the field of nanotechnologies.

It is intended to facilitate communication between organizations and individuals in research, industry and other interested parties and those who interact with them.

### 2 Normative references

There are no normative references in this document.
